## Data everywhere

Really "Big Data" - Data volume is increasing exponentially

# By the year 2020, the digital universe will reach 44 zettabytes – that's a 10-fold increase from 2013.

## Big data

Data analytics Data science Statistical learning

# Data everywhere

## Before:

- structured data,
- generated by companies and organizations,
- regular but not so frequent updates (e.g monthly).

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ ● のへで

## ► Now:

- unstructured data,
- generated by users,
- real time data.

# Data analytics

## A process:

- collecting,
- organizing (cleaning and storing),
- analyzing,
- visualizing

large sets of data.

An objective: discover useful information to improve business decisions.

## Data analytics

Data science

Statistical learning

Four major influences act on data analysis today:

- The formal theories of statistics.
- Accelerating developments in computers and display devices.
- The challenge, in many fields, of more and ever larger bodies of data.
- The emphasis on quantification in an ever wider variety of disciplines.

# Some definitions: Data science

Data science is an interdisciplinary field about processes and systems to extract knowledge or insights from data in various forms, either structured or unstructured, which is a continuation of some of the data analysis fields such as statistics, machine learning, data mining, and predictive analytics, similar to Knowledge Discovery in Databases (KDD). # Some definitions: Machine learning

Machine learning is a field of computer science that often uses statistical techniques to give computers the ability to "learn" (i.e., progressively improve performance on a specific task) with data, without being explicitly programmed. Big data

Data analytics

Data science

Statistical learning

# Some definitions: Statistical learning

Statistical learning theory is a framework for machine learning drawing from the fields of statistics and functional analysis. Statistical learning theory deals with the problem of finding a predictive function based on data. Statistical learning theory has led to successful applications in fields such as computer vision, speech recognition, bioinformatics and baseball. Data analytics Data science Statistical learning

# Statistical learning vs Machine learning

- Machine learning, from Artificial Intelligence: large scale applications, prediction accuracy.
- Statistical learning, from Statistics: interpretability, precision, uncertainty, inference.
- For some statisticians: statistical learning is a mathematical formalisation of the machine learning.

Data analytics Data science

Statistical learning

# Some concepts: online/offline learning

• Online learning (real-time): under time constraints.

Some examples:

- Personalized advertising.
- Personalized healthcare.
- Navigation & transit tools.
- Autonomous cars.
- Load curve forecasts.
- Weather forecasts.
- Offline learning (batch).

Big data

Data analytics

Data science

Statistical learning

<sup>D</sup>ractical nformations

36/42

# Some concepts: supervised/unsupervised learning

Big data

Data analytics

Data science

Statistical learning

Practical nformations

# Supervised learning: Infer (predict) a function/relationship from labeled

training data (e.g. classification, regression).

## Unsupervised learning:

Find "structure" in unlabeled data (e.g. clustering). Even if it is more subjective than supervised learning, it can be useful as a pre-processing step for supervised learning.

# Supervised learning

There are many different paradigms, including:

- Parametric statistics (linear or non-linear).
- Non-parametric statistics (local estimation methods, e.g smoothing kernel methods, k-nearest neighbors).

- Tree based methods.
- Support Vector Machines.
- Deep learning.

Data analytics

Statistical learning

Practical informations

38/42

- Trade-off between prediction accuracy and interpretability.
- Avoid over-fitting.
- Parsimonious model vs (full) black box: "less is more".
